Manual for Licensing of CSoft Development's products using Registration Wizard

This manual describes a licensing procedure of CSoft Development's products using the Registration Wizard.

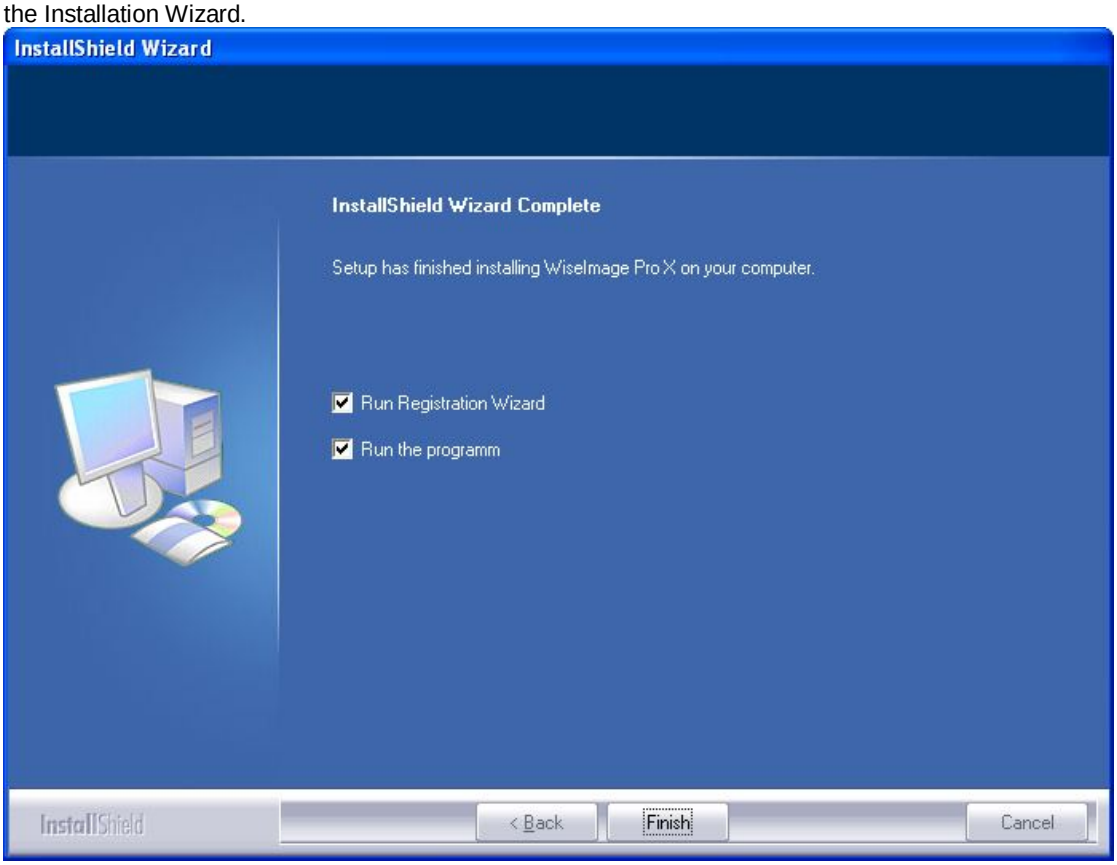

Additional pre-actions in case of using a Hardware Lock

1. Install the SENTINEL driver that is located on the installation disk (the *drivers* folder).
2. Insert your Hardware Lock into an appropriate port (LPT or USB).
3. If there are any Hardware Locks for other products, you should take them off before requesting a license.

Starting Registration Wizard

To obtain a license for your product you need to start the Registration Wizard with one of the following methods:

- **After your product has been installed:**
  To use this method, note that the *Run Registration Wizard* checkbox should be switched on in the final dialog of the Installation Wizard.

- **From folder in which your product is installed:**
  Select and run the *RegWizard.exe* file from the folder in which your application is installed.
- **From section of Windows Start menu:**
  On the Windows taskbar click the *Start* button, then click *Programs* (or *All Programs*) and then choose the *Registration Wizard* from the application section.

Choosing Required Task

From the *Registration Wizard* dialog pane choose one of the following options:

- If you don't have a license for your product, you should choose the *Request license* option to request a license. Then follow the instructions of Chapter "1. Request Local License".
- If you have a license obtained from CSoft Development's Licensing Service, you should choose the *Activate license* option. Then follow the instructions of Chapter "2. Activate local license".
- If you have the License Server installed and started, you should choose the *Connect to license server* option. Then follow the instructions of Chapter "3. Connect to License Server".

❖ **Note:** The procedure of installing and starting the License Server can be only executed by the network administrator in case of using network licensing. There is a special manual describing how to install the License Server and obtain a network license for it.

Click the *Next* button to continue.

1. Requesting Local License

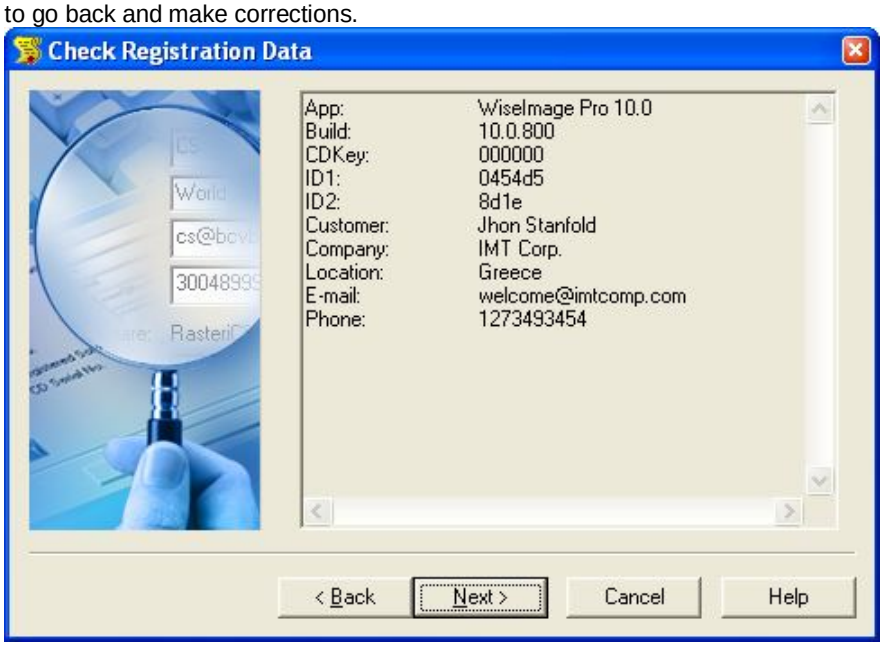

This chapter describes how to request a local license for your product from CSoft Development's Licensing Service.

1. In the *Registration Wizard* dialog choose the *Request license* option and then click the *Next* button.
2. Type the data required in the appropriate fields of the *Obtain Registration Data* dialog box.

- **In case of using a Hardware Lock:** Make sure, that the *Use Hardware Lock* checkbox is turned on in the *Obtain Registration Data* dialog.

3. The following box displays the data to be sent to CSoft Development's Licensing Service. Check your registration data and confirm it by clicking the *Next* button. If you have made a mistake, use the *Back* button to go back and make corrections.

- **Note:** Please double-check your registration data. If any field is filled incorrectly CSoft Development Licensing Service might reject your license request.

4. Finally, you need to send your registration data to CSoft Development's Licensing Service. This may be done on-line, by e-mail or fax. Also, your license request can be saved to a file to be sent from another computer.

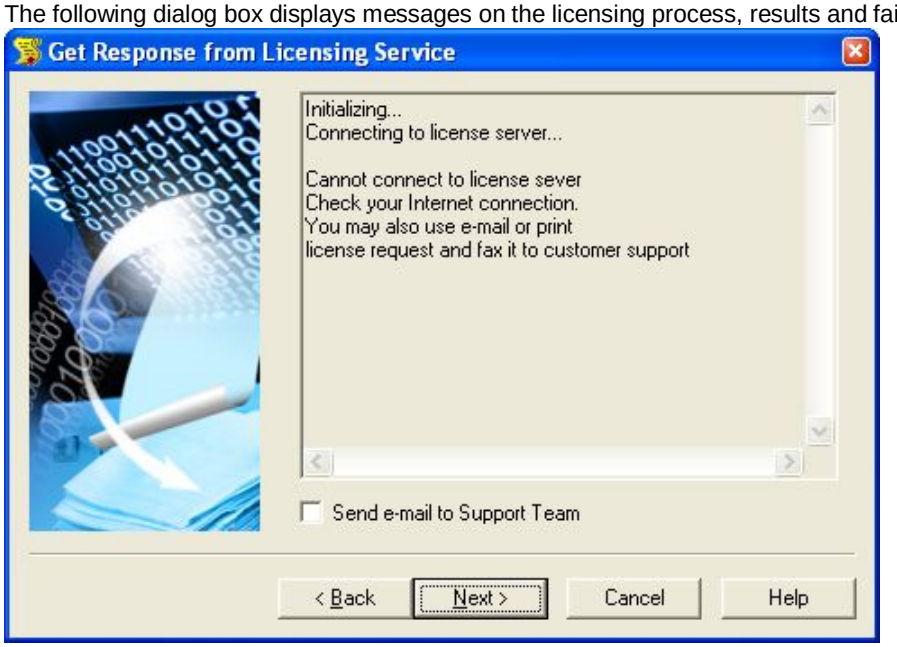

1. Requesting a License on-line and auto-activation

This method to request a license is preferable, as in this case the license file is not only requested but also obtained and activated automatically, so you don't have to execute the steps of Chapter "2. Activate local license".

Choose the *Request license online* option in the *Send Registration Data to Licensing Service* dialog box, and then is click the *Next* button. The program attempts to send your request.

The following dialog box displays messages on the licensing process, results and failure causes.

❖ **Note:** All files of local licenses received in such a way, are placed in the following folder:
`<DRIVE NAME>:\ Documents And Settings \ All Users \ Application Data \ CSoft \ RegWizard \ Licenses \`
If user has restricted rights on this computer, then files are placed in another folder:
`<DRIVE NAME>:\ Documents and Settings \ <USER NAME> \ Application Data \ CSoft \ RegWizard \ Licenses \`

If licensing is completed successfully

If licensing has been completed successfully, click the *Next* button, and then click the *Finish* button in the appeared *All done* dialog box, which contains the contact information.

Congratulations! The licensing of your CSoft Development product is completed successfully. Now you can use your product.

If the license request is denied

In case your request has been denied for some reasons, then click the *Next* button, and then click the *Finish* button in the appeared *All done* dialog box, which contains the contact information.

If you cannot connect to the Licensing Service

In case of a connection failure or impossibility of licensing with the selected method, go back to the *Send Registration Data to Licensing Service* dialog by clicking the *Next* button and select another method of licensing.

- You may also send an auto-created e-mail containing the full report of the Registration Wizard's operations to CSoft Development's Support Team. To do this before clicking the *Next* button you should turn on the *Send e-mail to Support Team* checkbox in the *Get Response from License Service* dialog box. However, this may be reasonable only if you guess that the failure in licensing online is caused by incorrect operation of the Registration Wizard.

2. Requesting a License by e-mail

This method is less preferable, as in this case you'll have to activate yourself the license file sent to you by e-mail – see Chapter "2. Activate Local License".

1. Select the *Request license by e-mail* option in the *Send Registration data to Licensing Service* dialog and click the *Next* button. Thus an e-mail will be created automatically with your request to CSoft Development's Licensing Service. Do not change anything in the e-mail (subject or contents), since this may cause an error in licensing procedure.
2. Click the *Send* button.
3. Click the *Finish* button the *All done* dialog box, which contains the contact information.

Congratulations! Your request for the licensing file has been sent.

Your request sent by e-mail will be processed automatically by the licensing robot, and you will get an e-mail containing the licensing file. Then you should restart the Registration Wizard, choose the *Activate license option* in the *Registration Wizard* dialog, and then follow the instructions of Chapter "2. Activate Local License".

3. Requesting License by Fax

You can also request the license file by fax.

For this do the following:

1. Select the *Print license request* option in the *Send Registration Data to Licensing Service* dialog box and click the *Next* button.
2. In the dialog that appears you should enter the required parameters and print your registration data.
3. Click the *Finish* button in the *All done* dialog box, which contains the contact information.
4. Transfer your request to CSoft Development by fax using fax number specified on printed page with the note: "License request for product <your product name>".

After receiving an e-mail or fax containing the license file, you should restart the Registration Wizard; then choose *Activate license* in the *Registration Wizard* dialog box and follow the instructions of Chapter "2. Activate Local License".

4. Sending License Request from another computer

If the Network Service is unavailable from your computer, you can save the license request to a file and then send it from another computer. For this do the following:

1. Select the *Save license request* to file option in the *Send Registration Data to Licensing Service* dialog box and click the *Next* button.
2. In the dialog that appears box you should select a file format for saving your license request, and also the file name and location.
3. Click the *Finish* button in the *All done* dialog box, which contains the contact information.
4. Transfer this file to the computer from which your license request may be sent.
5. If your file was saved in EML format, then open it with your mail program and then click the *Reply* button to send this one. Do not change the content or subject of the original e-mail; otherwise this might cause an error in the licensing procedure.
6. If your file was saved in a text format, then transfer your license request to CSoft Development by fax with the note: "License request for product <your product name>".

After receiving an e-mail or fax containing the license file, you should restart the Registration Wizard; then choose the *Activate license* option in the *Registration Wizard* dialog box and then follow the instructions of Chapter "2. Activate local license".

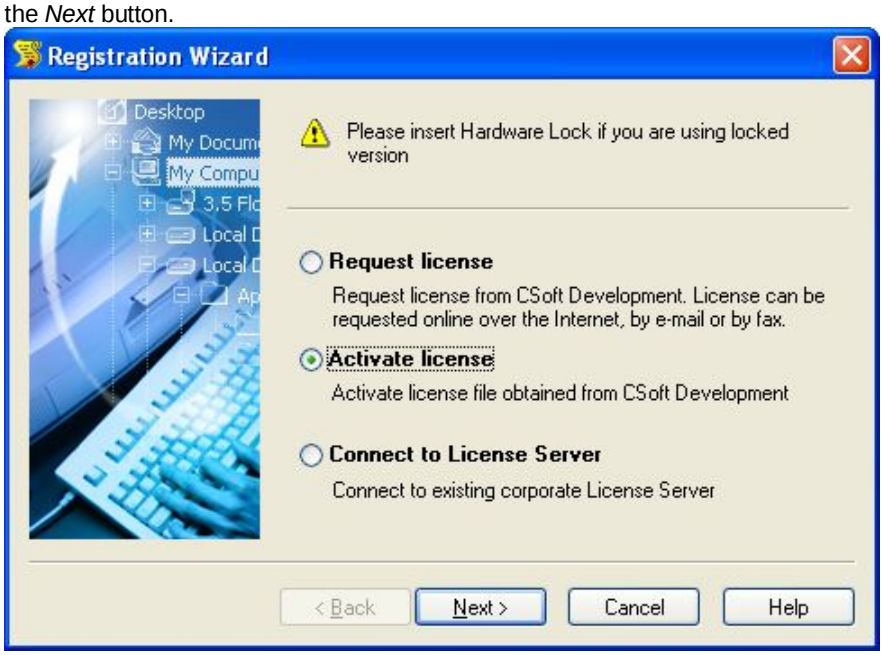

2. Activate Local License

This chapter describes how to activate your local license obtained from CSoft Development's Licensing Service.

- If your license request was sent on-line using the Registration Wizard and was completed successfully, in this case your license is already activated, and you can use your product.
- After requesting a license by e-mail, you will receive a message with attached license file on your e-mail address specified in the license request.
- If the requested license was received by fax, then you should copy fax text into a text file using any text editor and save it with the LIC extension.
- Follow the additional instructions of the e-mail or fax you received, if any.

Now copy the file to the computer with the product to be licensed.

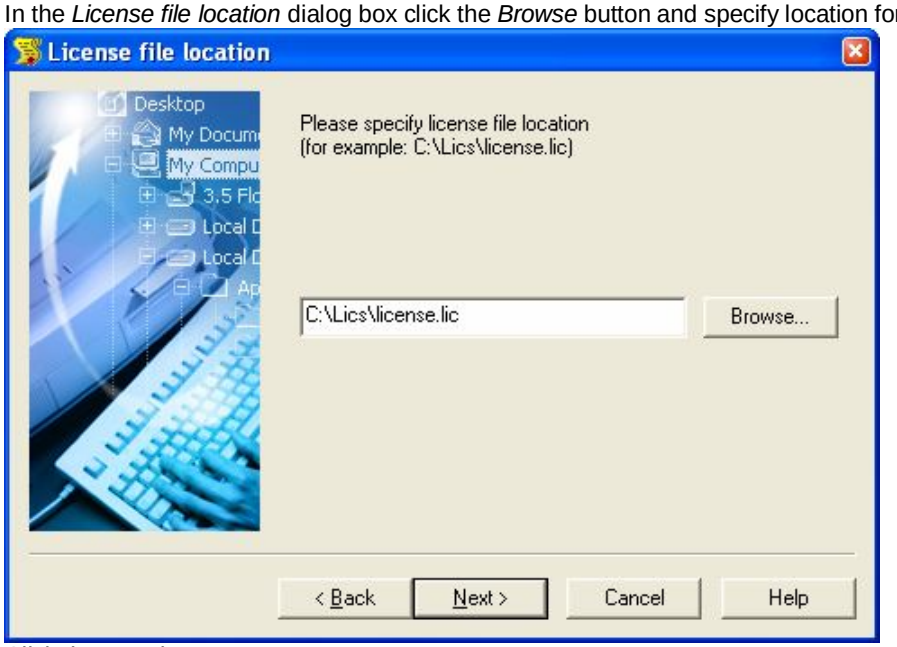

1. Start the Registration Wizard for the product to be licensed, then select the *Activate license* option and click the *Next* button.

2. Choose the *License file* option in the appeared dialog box and click the *Next* button.

❖ Choose the *Authorization Code* option if you have an authorization code.

3. In the *License file location* dialog box click the *Browse* button and specify location for the license file.

Click the *Next* button.

4. Click the *Finish* button in the *All done* dialog box, which contains the contact information.

Congratulations! The licensing of your CSoft Development product is completed successfully. Now you can use your product.

3. Connect to License Server

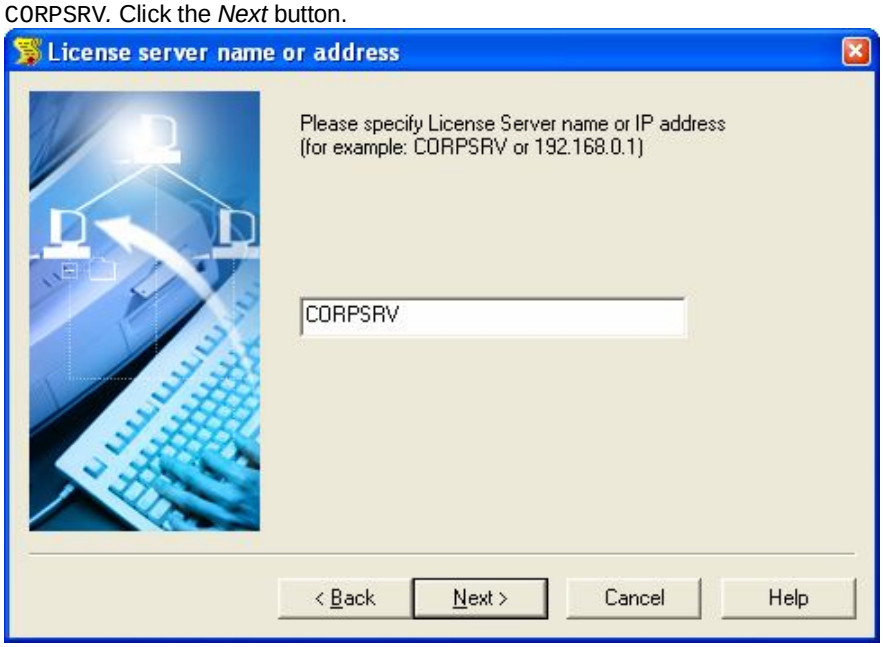

This chapter describes how to connect to the License server in case of using network licensing. The procedure of installing and starting the License Server can be only executed by the network administrator. There is a special manual describing how to obtain a network license and install the License Server.

To get connected to the License Server, your computer must have constant access to the installed and running network server with activated TCP/IP protocol.

1. Start the Registration Wizard for the product to be licensed over the License Server, then select the *Connect to license server* option and click the *Next* button.

2. In the next dialog box you should specify the IP of the computer on which the License Server is installed, for example: `192.168.0.1`, or specify the computer NetBIOS-name in the local network, for example: `CORPSRV`. Click the *Next* button.

3. Click the *Finish* button in the *All done* dialog box, which contains the contact information.

Congratulations! The licensing of your CSoft Development product is completed successfully. Now you can use your product.

Glossary

Dongle

See Hardware Lock.

Hardware Lock

An electronic device (dongle) that is used as hardware component of application licensing. It can be USB or LPT port compatible and should be inserted during a license request and software usage. Usually, the software license is linked with the appropriate computer. In case of dongle using, the software license is linked with an appropriate Hardware Lock and can be used on any computer wherever this one is inserted.

License file

A file with a LIC extension that includes one or more licenses.

License Server

A FLEXlm based server that performs a network licensing of applications.

License Server Setup

A software utility that is used to install, launch and manage the License Server and to obtain network licenses for it.

Licensing Service

A remote internet service that performs generating and sending licenses for each request created with the Registration Wizard and the License Server Setup.

LicServSetup.exe

A License Server Setup executable file.

Local license

A license placed in a license file that gives rights to work with the software application. This type of license is obtained for each computer with installed software application. This license is requested and activated using the Registration Wizard.

Network license

A license placed in a license file that gives rights to work with the software application. This type of license is obtained for the License Server. This license is requested and activated using the License Server Setup.

Node Locked license

See Local license.

Registration Wizard

A software utility that is used to obtain and activate local licenses for CSoft Development applications or to connect these applications to the License Server in case of network licensing.

Regwizard.exe

A Registration Wizard executable file.
